Details**

The Local Water Challenge

South Texas faces a growing groundwater crisis — and long-term projects won't arrive in time

THE ISSUE TODAY

Increased groundwater
withdrawals

Dependence on Evangeline Aquifer

Declining well levels

Rising salinity in local supply

Why This Can't Wait

- Long-term infrastructure projects take years to plan and build
- Demand on the Evangeline Aquifer is increasing now — not in the future
- **Goliad** relies almost entirely on well water — there is no backup

The Opportunity Right Now

- Treat existing well water in place — no new source required
- Improve water quality and reduce salinity with proven EM technology
- Reduce dependency on outside sources and protect local supply long-term

The Purionex Solution

Modular, patent-protected water treatment designed for exactly this challenge

01

EM Conditioning

Proprietary Electromagnetic treatment disrupts scale-forming minerals and reduces chemical dependency (Patent No. 12,129,190 B1)

02

Nanobubble Oxidation

Nano-bubblers inject micro-fine oxygen to oxidize iron, manganese, and sulfur — without harsh chemical dosing

03

Submicron Filtration

Removes suspended solids, bacteria, and contaminants down to submicron level for consistent, clean output

04

FlowSignal™ Monitor

Real-time water quality monitoring, automated alerts, and compliance reporting — always knowing what's flowing

90%+

Water Recovery

500K–1M

GPD Per Module

16–20 wk

Delivery Time

< RO Cost

vs. Reverse Osmosis

Proven Results

Tested on high-TDS, difficult source water — the same conditions south Texas faces

WHAT THE TESTING SHOWS

- Successfully treated high TDS (total dissolved solids) water comparable to Evangeline Aquifer conditions
- Significant reduction in iron, manganese, sulfur, and hardness-causing minerals
- 90%+ water recovery — minimal waste and minimal impact on aquifer draw
- Works on difficult, variable source water where conventional RO systems struggle
- Consistent output quality maintained across variable input conditions

Extend Well Life

Reducing scale and mineral buildup protects wellbore and pump equipment — lowering O&M costs and deferring costly well replacement

Improve Water Quality

Deliver cleaner, safer water to residents and businesses — meeting or exceeding Texas drinking water standards

Protect Local Supply

Reduce aquifer draw through recycling and efficiency — preserving the Evangeline for future generations and local growth

Deployment Plan

A phased approach — from pilot to full protection in months, not years

PHASE 1 | Demo & Pilot

Weeks 1–8

- Provide water samples from wells to DXP testing facility
- Lab analysis characterizes exact water chemistry
- Configure DCU payload for specific conditions
- Demo unit deployed and tested on live source water

PHASE 2 | First Unit Install

Months 2–5

- Finalize site engineering for first 500K–1M GPD unit
- Unit manufactured and shipped (16–20 week lead)
- Installation and commissioning at facility
- FlowSignal™ monitoring activated with live data dashboard

PHASE 3 | Scale Deployment

Months 5+

- Assess pilot results and expand to additional units as needed
- Standardized platform — same parts, same training, easy O&M
- Ongoing monitoring and optimization with Purionex support
- Evaluate additional well sites for broader coverage

Funding Options

Multiple Texas and federal programs available — Purionex will help you navigate them

Your County may qualify for grant and loan funding that significantly reduces or eliminates direct capital cost for this project.

Texas Water Development Board

- State Water Implementation Fund for Texas (SWIFT) — low-interest loans for water infrastructure projects
- Water Infrastructure Fund (WIF) — grants and loans for eligible political subdivisions
- Economically Distressed Areas Program (EDAP) — targeted funding for underserved communities

USDA Rural Development

- Water & Waste Disposal Loan & Grant Program — for rural communities and small water systems
- Emergency Community Water Assistance Grants — for areas experiencing water supply emergencies
- Rural Energy for America Program — for energy-efficient water treatment infrastructure

Additional Resources

- EPA Drinking Water State Revolving Fund (DWSRF) — low-cost financing through TCEQ
- FEMA Hazard Mitigation — drought and water security mitigation grants
- Purionex can assist with identifying, applying for, and administering grant programs

Why Purionex

The right partner for Goliad's water security

Patent-Protected Technology

U.S. Patent No. 12,129,190 B1. EM Treatment + Nano-bubblers — a process no competing provider offers. Proven on difficult Texas groundwater.

Fast Deployment

16–20 week delivery from order to installation. Purpose-built for communities that need water security now, not after a multi-year project.

Lower Cost Than RO

Significantly lower capital and operating cost versus reverse osmosis. 90%+ recovery means less waste and lower ongoing energy and chemical expense.

DXP & PWS Partners

Backed by DXP Enterprises (NASDAQ: DXPE, \$1.95B) for nationwide manufacturing, distribution, service, and deployment infrastructure.

Scalable Platform

Start with a single 500K GPD pilot unit. Scale to 1M GPD or multiple units as needs grow — same platform, same O&M, no retraining.

Local Commitment

Purionex is invested in supporting long-term water independence. American-engineered, Texas-focused, and committed to local community outcomes.

How to Get Started

Four simple steps from today's meeting to water flowing

01

Provide Water Data

Share existing well water analysis reports or arrange for Purionex to collect fresh samples from Goliad well sites for lab testing at DXP's facility.

02

Engineering Review

Purionex and DXP engineers review your water chemistry, site conditions, and volume requirements to configure the optimal DCU payload.

03

Demo & Testing

A demonstration unit is deployed on live Goliad source water. You see the results firsthand — water quality before and after — before any commitment to full deployment.

04

Purchase Order + Pilot

A purchase order and deposit kicks off manufacturing of your first unit. 16–20 weeks to installation, commissioning, and live water flowing through Goliad's system.

PROTECT YOUR WATER — LET'S GET STARTED
